Effect of different surfactants on emulsion polymerization of vinyl-acrylic latex

CTT 2023

Why Vinyl-Acrylic?

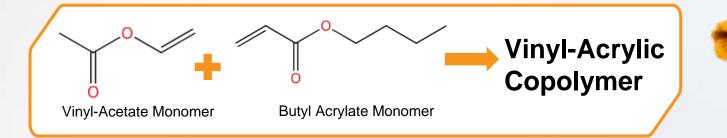

- Surfactants under study
- Effect of Nonionic to Anionic Ratio
- 4
- Effect of EO chain length in Anionic Surfactant
- 5

6

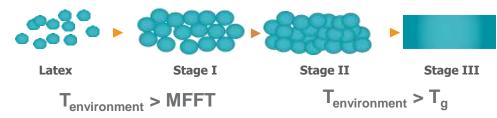

- Effect of EO chain length in Nonionic Surfactant
- Paint evaluation

Conclusion

VINYL-ACRYLIC POLYMER: ADVANTAGES AND CHALLENGES

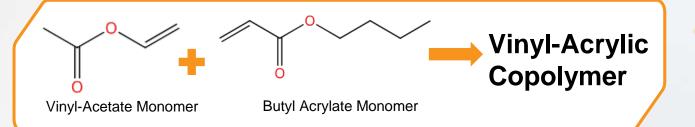

- ✓ Large availability and low cost
- ✓ Hydroplasticization of the particles
- ✓ MFFT << Tg</p>

- Low coalescing agent demand
- Low VOC Paints

VINYL-ACRYLIC POLYMER: ADVANTAGES AND CHALLENGES

- ✓ High solubility of the vinyl-acetate monomer in water
- Difficulty to adsorb surfactants on the Surface of the particles to improve stability
- ✓ Replacement of APE-based surfactants
- Market Scenario difficult to find raw material hence improving the toolbox of solutions is key.

Emulsion Polymer Formulation

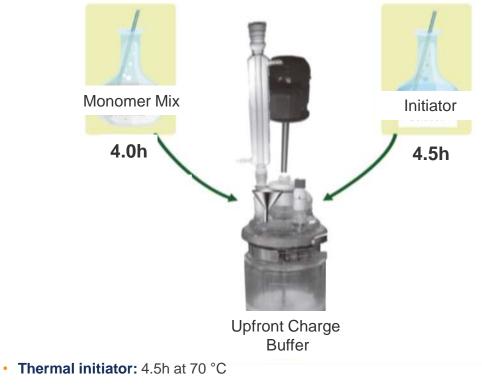

Goal: to evaluate different ratios of

nonionic to anionic surfactant

95:5 / 85:15 / 70:30

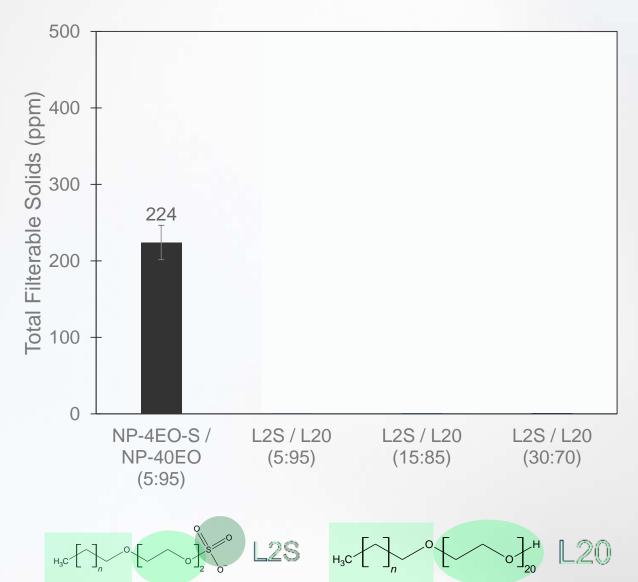

Components (phm)	Formulation 1	
Vinyl Acetate	80 %	
Butyl acrylate	20 %	
	Active Content (phm)	
Surfactant L20	3.08 – 4.18	
Surfactant L2S	0.22 – 1.32	
Persulfate initiator		
Chase Redox		

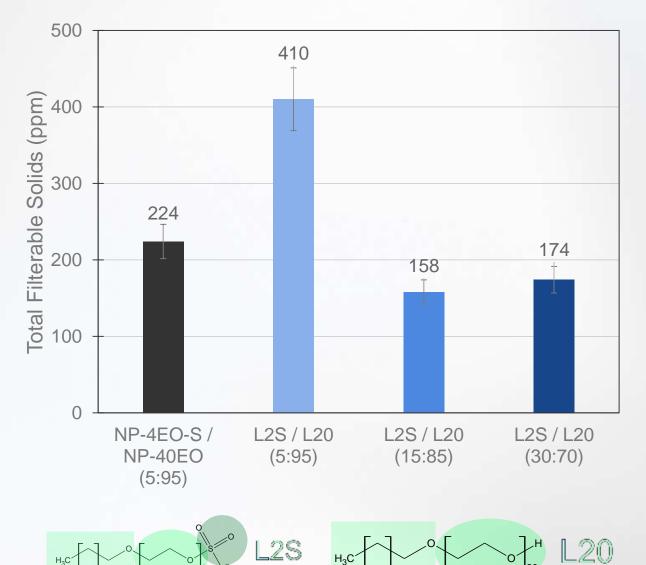

Solid content: 55 wt.%

Reactor Cleanliness

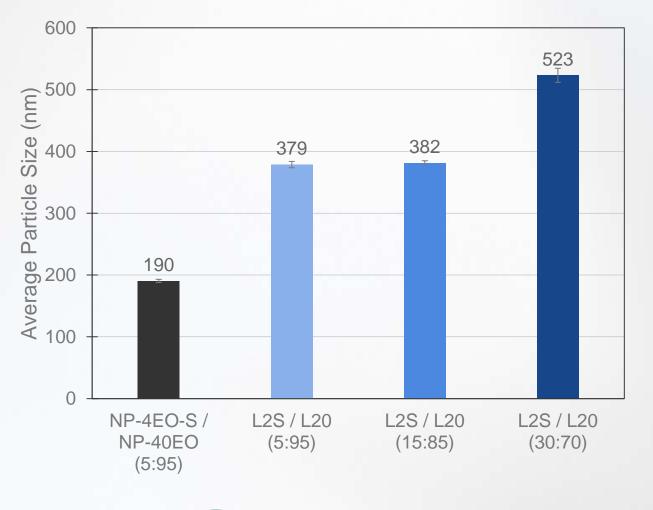

Reactor Cleanliness

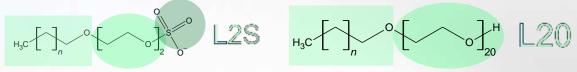

✓ Clot formation < 500 ppm for all formulations.</p>

✓ Results comparable or better than reference.

Particle Size

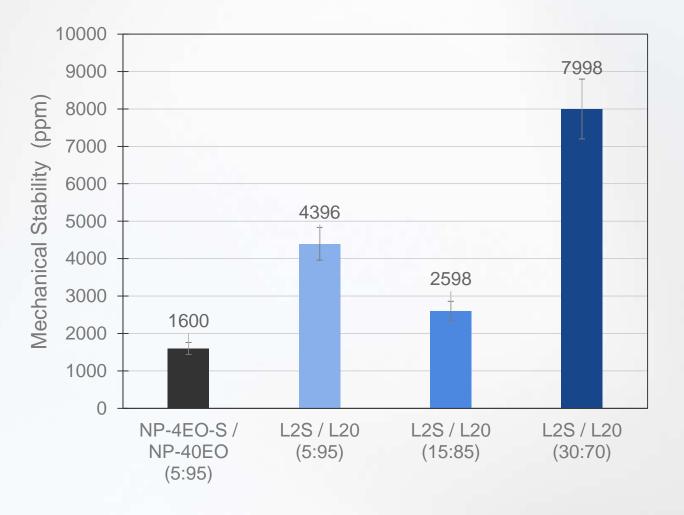

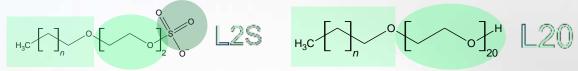

Acceptable particle size range is 200 – 400nm.

✓ High nonionic content delivered better particle size control.

Mechanical Stability

 Less than 1.0% clot formed under shear stress.

 High nonionic content delivered better stability.

Effect of different ratios of nonionic to anionic Electrolytic Stability

 $H_{3C} \left[\begin{array}{c} 0 \\ 1 \\ n \end{array} \right]_{2}^{0} \left[\begin{array}{c} 0 \\ 1 \\ 2 \\ 0 \end{array} \right]_{2}^{0} \left[\begin{array}{c} 0 \\ 1 \\ 2 \\ 0 \end{array} \right]_{2}^{0} \left[\begin{array}{c} 0 \\ 1 \\ 2 \\ 0 \end{array} \right]_{2}^{0} \left[\begin{array}{c} 0 \\ 1 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}{c} 2 \\ 0 \end{array} \right]_{2}^{H} \left[\begin{array}[0 \\ 0 \end{array} \right]_{2}^{$

 Very high electrolytic stability for all formulations.

 High nonionic content improves steric barrier and delivered better stability.

Wrap up

- Surfactants L2S and L20 delivered a clean reactor, low particle size and stable vinyl-acrylic emulsion polymer;
- Even being less ethoxylated than the reference APE-based surfactant, the results indicated that they are suitable alternatives;
- Adjustments in the composition might improve the result. There might be an optimized composition between 5:95 and 15:85 ratio of nonionic to anionic.

Emulsion Polymer Formulation

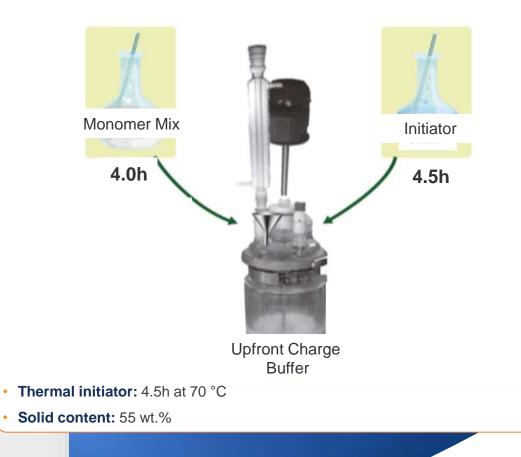

Goal: to evaluate different anionic surfactants

at two different nonionic:anionic ratio

95:5 and 85:15

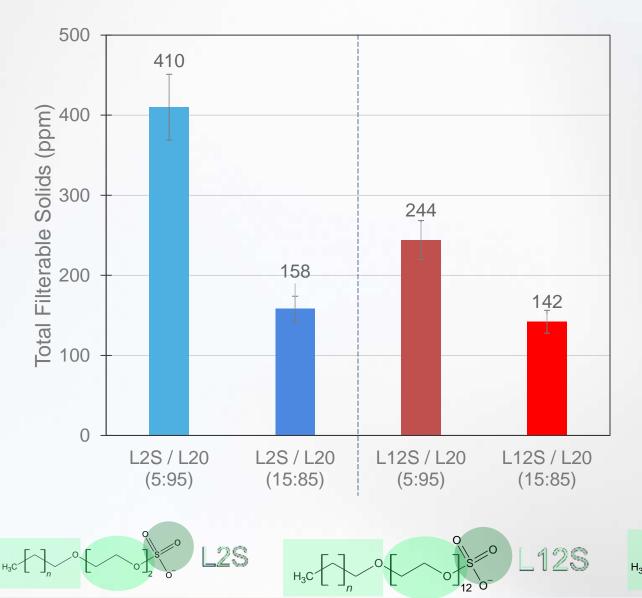

Components (phm)	Formulation 2
Vinyl Acetate	80 %
Butyl acrylate	20 %
	Active Content (phm)
Surfactant L20	3.74 – 4.18
Surfactant L2S or L12S	0.22 - 0.66
Persulfate initiator	
Chase Redox	

PROCESS

Effect of different anionic surfactants

Reactor Cleanliness

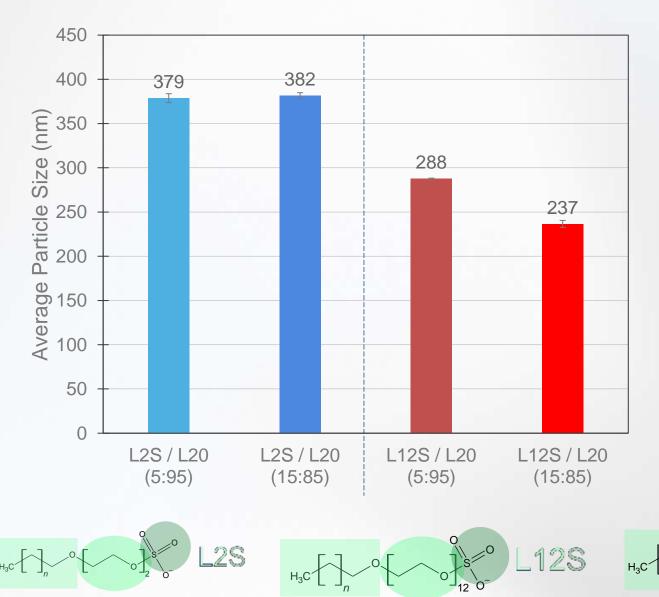

✓ Clot formation < 500 ppm for all formulations.</p>

 Longer ethylene oxide chain in the anionic improved the performance even at a low dosage.

Effect of different anionic surfactants

Particle Size

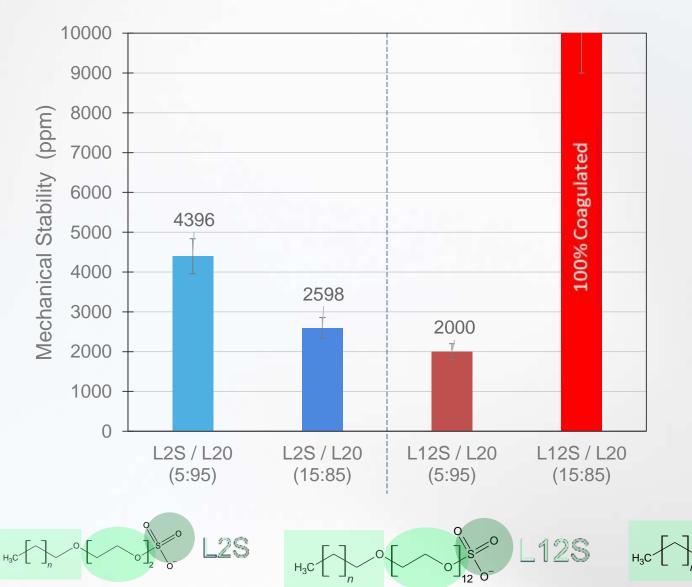

Acceptable particle size range is 200 – 400nm;

 Longer ethylene oxide chain tends to decrease the particle size.

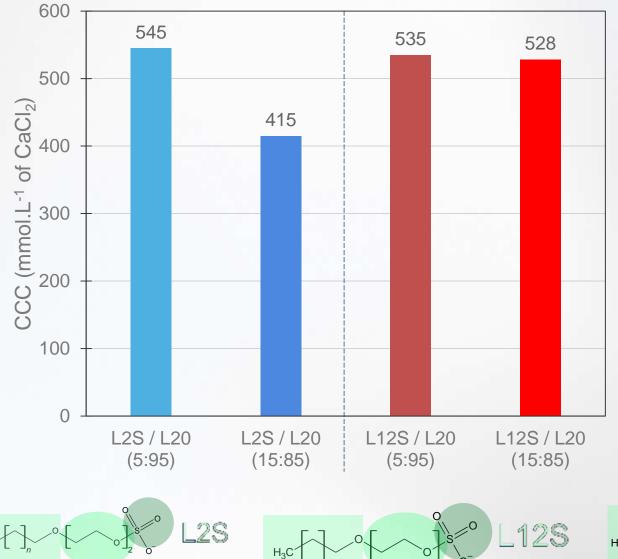

Effect of different anionic surfactants Mechanical Stability

 Longer ethylene oxide chain improved the mechanical stability for low anionic content formula;

 High anionic content with longer EO chain destabilized the latex.

Effect of different anionic surfactants Electrolytic Stability

 Very high electrolytic stability for all formulations.

✓ Little effect when increasing the EO chain in the anionic surfactant.

Wrap up

- The longer EO chain anionic surfactant improved the overall stability of the vinyl-acrylic emulsion polymer for the same nonionic surfactant;
- Both short and long EO chain anionic delivered good results, which gives flexibility to the manufacturer;
- However, different ratios of nonionic to anionic need to be studied to fine tune the formulation. Substitution is not always a drop in.

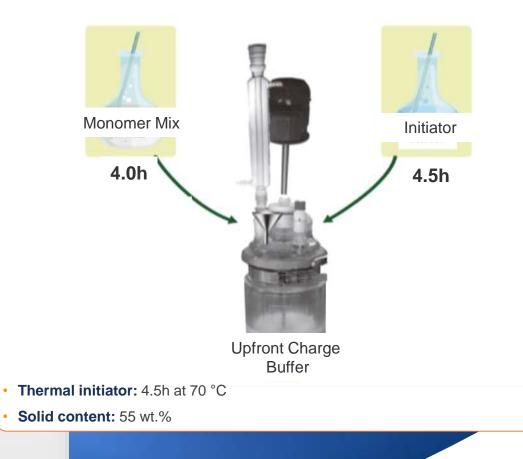

Emulsion Polymer Formulation

Goal: to evaluate different nonionic surfactants

at a fixed nonionic:anionic ratio of 95:5

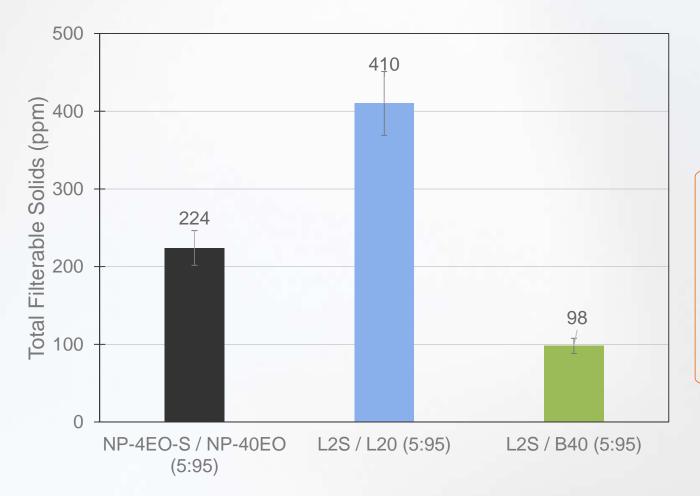

Components (phm)	Formulation 3
Vinyl Acetate	80 %
Butyl acrylate	20 %
	Active Content (phm)
Surfactant L20 or B40	4.18
Surfactant L2S	0.22
Persulfate initiator	
Chase Redox	

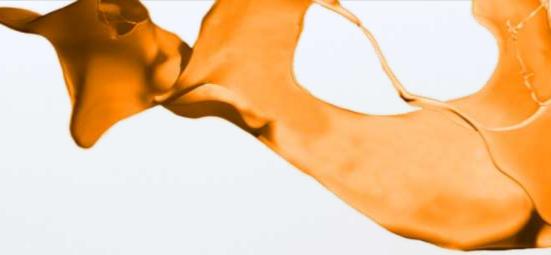

PROCESS

Effect of different nonionic surfactants

Reactor Cleanliness

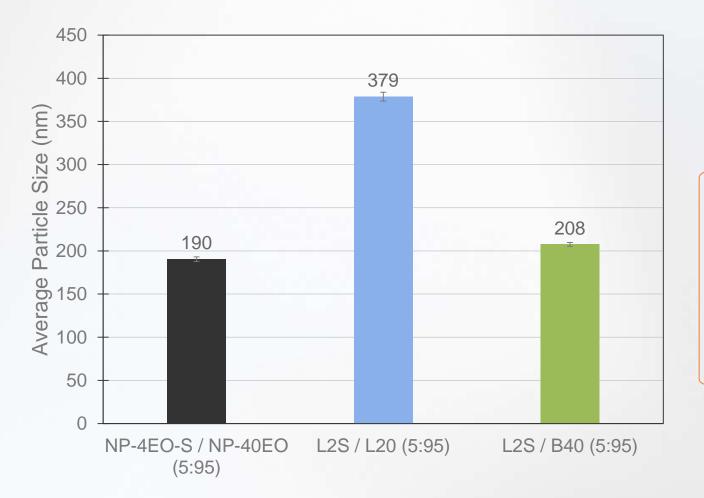

✓ Clot formation < 500 ppm for all formulations.</p>

 Longer ethylene oxide chain in the nonionic improved the performance even compared against reference.

B40

Effect of different nonionic surfactants

Particle Size

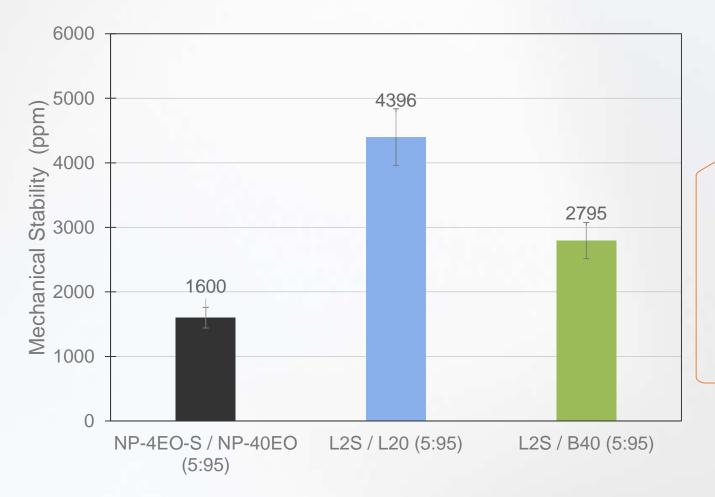

- Acceptable particle size range is 200 400nm;
- ✓ Longer ethylene oxide chain in the nonionic surfactant tends to decrease the particle size as seen for the anionic.

B40

CH₂

Effect of different nonionic surfactants

Mechanical Stability

 Longer EO chain in the nonionic improved the mechanical stability;

✓ Combining longer EO chain in both surfactants might boost results.

B40

Effect of different nonionic surfactants Electrolytic Stability

 Very high electrolytic stability for all formulations.

 Longer EO nonionic improved the steric barrier and delivered higher stability to electrolytes.

B40

CH₂

Wrap up

- The longer EO chain nonionic surfactant also improved the overall stability of the vinyl-acrylic emulsion polymer for the short EO anionic surfactant;
- Both short and long EO chain nonionic delivered good results, which gives flexibility to the manufacturer;

B40

• Combining longer EO chain in both surfactants might boost results.

Paint Formulation

Goal: to evaluate the performance of a few of the emulsion polymers synthesized against benchmarks

Paint Formulation

PVC ~ 45 %

Vinyl-Acrylic Emulsion ~ 35 %

Coalescing Agent ~ 2 %

VOC < 15 g/L

Viscosity = $100 \pm 5 \text{ KU}$

pH = 9.0

Emulsion Polymers Tested

Benchmark APE-based

Benchmark APE-free

NP-4EO-S / NP-40EO (5:95)

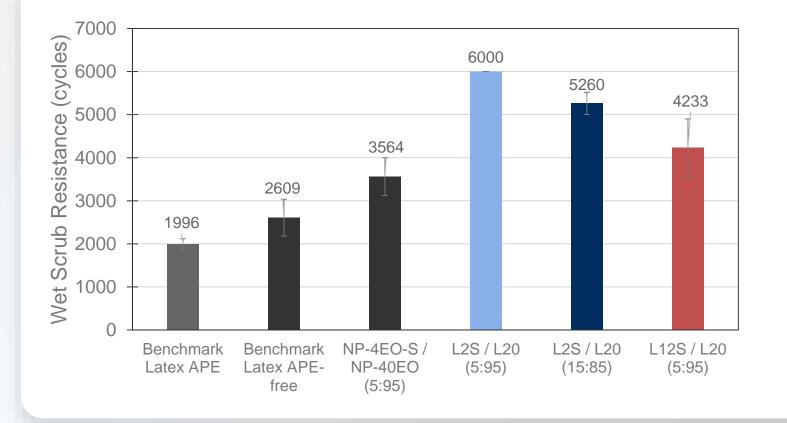

L2S / L20 (5:95)

L2S / L20 (15:85)

L12S / L20 (5:95)

Conclusions

- When replacing APE-based by APE-free surfactants, the ratio of nonionic to anionic can change. Ladder studies are advisable to fine tune composition;
- ✓ Longer Ethylene Oxide chain anionics and nonionics seem to improve overall stability BUT be careful on the ratio;
- Paint performance can be improved when replacing APE-based surfactants by APE-free ones;
 - Developing a toolbox of alternatives is advisable, considering market fluctuations, and possible, considering technical performance.

THANK YOU VERY MUCH FOR YOUR ATTENTION!
